

Understanding the ecology and its necessity: I always compare the land to a person. Take a friend, you prick with a needle. It will only jump to the location of the sting. Then, if you insist several times and different places, it will return a slap, even if he appreciates you. The Earth has the same behaviour. Pollution, resource depletion are like a needle. The Earth is startled by making small earthquakes. But because of pollution, to destroy all that money, it will balk because it chokes, as the person with the needle. And then we will suffer the reactions of our actions.
